SMB Chromatography — a practical application

Purified Artemisinin

- Artemisinin is the basic compound for producing the malaria medication Artesunate.
- New SMB-based process developed at MPI Magdeburg (PCF roup) yields 99.5% purity (exceeding the limits set by WHO and FDA), based on new synthesis process invented by Peter Seeberger (MPI Colloids and Interfaces, Potsdam).
- Process can be easily implemented in low-cost plants in the countries where the plant *Artemisia annua* grows, mostly, in East Asia.
- Model plant built in Vietnam.
- Much cheaper than current anti-Malaria medication, and much higher degree of purity!

Numerical Exam

Conclusions

Empirical Interpolation Method (EIM)

Idea: construct a basis of interpolation functions (vectors), and use an affine expression to approximate $W^T f(Vz, \mu)$, i.e.,

$$W^T f(Vz,\mu) \approx \underbrace{W^T U}_{\text{Precomputed}} \beta(z,\mu).$$

Different methods have been proposed to construct the basis $U \in \mathbb{R}^{n \times M}$ and the corresponding coefficients $\beta(z, \mu)$:

Empirical interpolation method (EIM)

[BARRAULT/MADAY/NGUYEN/PATERA '04]

Missing point estimation (MPE)

[Astrid/Weiland/Willcox/Backx '08, Fassbender/Vendl '11]

Discrete empirical interpolation method (DEIM)

[Chaturantabut/Sorensen '10]

Empirical operator interpolation

[Drohmann/Haasdonk/Ohlberger '12]

MOR for Nonlinear Parametric Systems

Original full order system (FOM)

$$E(t,\mu)\frac{\mathrm{d}x}{\mathrm{d}t} = A(t,\mu)x + f(x,\mu),$$

or

$$E(t^{k},\mu)x^{k+1} = A(t^{k},\mu)x^{k} + f(x^{k},\mu).$$

Reduced-order model (ROM)

$$\hat{\Xi}(t,\mu)\frac{\mathrm{d}z}{\mathrm{d}t} = \hat{A}(t,\mu)z + W^T f(Vz,\mu), \qquad \hat{x} := Vz,$$

or

Ê

$$\begin{split} \hat{E}(t^k,\mu)z^{k+1} &= \hat{A}(t^k,\mu)z^k + W^T f(Vz^k,\mu) \quad \hat{x}^k := Vz^k, \\ \hat{T} &= W^T EV, \ \hat{A} = W^T AV, \ W, V \in \mathbb{R}^{n \times N}, \ z, z^k \in \mathbb{R}^N, \ N \ll n. \end{split}$$

MOR for Nonlinear Parametric Systems

Original full order system (FOM)

$$E(t,\mu)\frac{\mathrm{d}x}{\mathrm{d}t} = A(t,\mu)x + f(x,\mu),$$

or

$$E(t^{k},\mu)x^{k+1} = A(t^{k},\mu)x^{k} + f(x^{k},\mu).$$

Use Empirical Interpolation to efficiently compute $W^T f(Vz, \mu)$

$$\hat{\Xi}(t,\mu)\frac{\mathrm{d}z}{\mathrm{d}t} = \hat{A}(t,\mu)z + \underline{W^{\mathsf{T}}U}\beta(z,\mu),$$

or

$$\hat{E}(t^k,\mu)z^{k+1} = \hat{A}(t^k,\mu)z^k + \underline{W^T U}\beta^k(z,\mu).$$

The fast computation can be achieved by the strategy of offline-online decomposition, i.e., \hat{E} , \hat{A} and $\underline{W^{T}U}$ can be precomputed once V, W, U are obtained.

Error	Bound		

Consider the evolution scheme,

$$E(t^{k},\mu)x^{k+1} = A(t^{k},\mu)x^{k} + f(x^{k},\mu),$$

$$y^{k+1} = Cx^{k+1}.$$

The reduced-order model (ROM):

$$\hat{E}(t^{k},\mu)z^{k+1} = \hat{A}(t^{k},\mu)z^{k} + W^{T}f(Vz^{k},\mu), \hat{y}^{k+1} = CVz^{k+1}.$$

Here, $\hat{E}(t^{k}, \mu) = W^{T}E(t^{k}, \mu)V$, $\hat{A}(t^{k}, \mu) = W^{T}A(t^{k}, \mu)V$, $\hat{x}^{k} := Vz^{k}$ approximates x^{k} , $k = 0, ..., T_{n}$.

Define the residual:

$$r^{k+1}(\mu) := A(t^k,\mu)\hat{x}^k + f(\hat{x}^k,\mu) - E(t^k,\mu)\hat{x}^{k+1}.$$

We have the following error estimations.

Primal-only Error Bound

Field Variable Error Bound

Theorem (Error Bound 1)

[Drohmann/Haasdonk/Ohlberger '12, Zhang/Feng/Li/Benner '14]

Let $e^k(\mu) := x^k - \hat{x}^k$ and $e^k_O(\mu) := y^k - \hat{y}^k$ be the error for the solution and the output at time step t^k , respectively. Under certain assumptions, we have:

$$\|e^{1}(\mu)\| \leq \eta_{N,M}^{1}(\mu) := \mathsf{R}_{\mathsf{F},\mu}^{(0)}, \\ \|e^{k}(\mu)\| \leq \eta_{N,M}^{k}(\mu) := \mathsf{R}_{\mathsf{F},\mu}^{(k-1)} + \sum_{i=0}^{k-2} \left(\prod_{j=i+1}^{k-1} \mathsf{G}_{\mathsf{F},\mu}^{(j)}\right) \mathsf{R}_{\mathsf{F},\mu}^{(i)}, \quad k = 2, \dots, T_{n}.$$

where

$$R_{\mathsf{F},\mu}^{(i)} = \left\| E(t^{i},\mu)^{-1}r^{i+1}(\mu) \right\|, \quad i = 0, \dots, k-1,$$

$$G_{\mathsf{F},\mu}^{(j)} = \left\| E(t^{j},\mu)^{-1}A(t^{j},\mu) \right\| + L_{\mathsf{f}} \left\| E(t^{j},\mu)^{-1} \right\|, \quad j = i+1, \dots, k-1.$$

Error Bound

Primal-only Error Bound (Cont.)

Output Error Bound

Theorem (Output Error Bound 1) [Zhang/Feng/Li/Benner '14]

Under the assumptions of Prop. 1, we have:

$$\|e_{\mathsf{O}}^{k+1}(\mu)\| \leq G_{\mathsf{O},\mu}^{(k)}\eta_{\mathsf{N},\mathsf{M}}^{k}(\mu) + \|C\|\|E(t^{k},\mu)^{-1}r^{k+1}(\mu)\|,$$

where

$$G_{\mathrm{O},\mu}^{(k)} = ||CE(t^k,\mu)^{-1}A(t^k,\mu)|| + L_f||CE(t^k,\mu)^{-1}||.$$

Primal-dual Output Error Bound

"Dual" system and the reduced "dual" system

$$E(t^k,\mu)^T x_{du}^{k+1} = -C^T, \quad W_{du}^T E(t^k,\mu)^T V_{du} z_{du}^{k+1} = -W_{du}^T C^T.$$

Here, $\hat{x}_{du}^k := V_{du} z_{du}^k$ approximates x_{du}^k , $k = 1, \dots, T_n$.

"Dual" system and the reduced "dual" system

$$E(t^k,\mu)^T x_{\mathrm{du}}^{k+1} = -C^T, \quad W_{\mathrm{du}}^T E(t^k,\mu)^T V_{\mathrm{du}} z_{\mathrm{du}}^{k+1} = -W_{\mathrm{du}}^T C^T.$$

Here, $\hat{x}_{du}^k := V_{du} z_{du}^k$ approximates x_{du}^k , $k = 1, \dots, T_n$.

Residual of the reduced dual system:

$$r_{\mathsf{du}}^{k+1}(\mu) := -C^{\mathsf{T}} - E(t^k, \mu)^{\mathsf{T}} \hat{x}_{\mathsf{du}}^{k+1}.$$

Recall residual of the ROM:

$$r^{k+1}(\mu) := A(t^k,\mu)\hat{x}^k + f(\hat{x}^k,\mu) - E(t^k,\mu)\hat{x}^{k+1}.$$

"Dual" system and the reduced "dual" system

$$E(t^k,\mu)^T x_{\mathrm{du}}^{k+1} = -C^T, \quad W_{\mathrm{du}}^T E(t^k,\mu)^T V_{\mathrm{du}} z_{\mathrm{du}}^{k+1} = -W_{\mathrm{du}}^T C^T.$$

Here, $\hat{x}_{du}^k := V_{du} z_{du}^k$ approximates x_{du}^k , $k = 1, \dots, T_n$.

Residual of the reduced dual system:

$$r_{\mathsf{du}}^{k+1}(\mu) := -C^{\mathsf{T}} - E(t^k, \mu)^{\mathsf{T}} \hat{x}_{\mathsf{du}}^{k+1}.$$

Recall residual of the ROM:

$$r^{k+1}(\mu) := A(t^k,\mu)\hat{x}^k + f(\hat{x}^k,\mu) - E(t^k,\mu)\hat{x}^{k+1}.$$

Define an auxiliary vector,

$$\begin{aligned} \tilde{r}^{k+1}(\mu) &:= & A(t^k, \mu) x^k + f(x^k, \mu) - E(t^k, \mu) \hat{x}^{k+1} \\ &= & E(t^k, \mu) x^{k+1} - E(t^k, \mu) \hat{x}^{k+1}. \end{aligned}$$

Theorem (Output Error Bound 2) [Zhang/Feng/Li/Benner '15]

Assume that $E(t^k, \mu)$ is invertible, then the output error $e^k_O(\mu) := y^k - \hat{y}^k$ satisfies

$$\|e^k_{\mathsf{O}}(\mu)\| \leq ilde{\Delta}^k(\mu), \quad k = 1, \dots, T_n,$$

where

$$\begin{split} \tilde{\Delta}^{k}(\mu) &:= \Phi^{k}(\mu) || \tilde{r}^{k}(\mu) ||, \\ \Phi^{k}(\mu) &= \| E(t^{k-1}, \mu)^{-T} \| \| r_{\mathsf{du}}^{k}(\mu) \| + \| \hat{x}_{\mathsf{du}}^{k}(\mu) \|. \end{split}$$

Theorem (Output Error Bound 2) [Zhang/Feng/Li/Benner '15]

Assume that $E(t^k, \mu)$ is invertible, then the output error $e^k_O(\mu) := y^k - \hat{y}^k$ satisfies

$$\|e^k_{\mathsf{O}}(\mu)\| \leq ilde{\Delta}^k(\mu), \quad k = 1, \dots, T_n,$$

where

$$\begin{split} \tilde{\Delta}^{k}(\mu) &:= \Phi^{k}(\mu) || \tilde{r}^{k}(\mu) ||, \\ \Phi^{k}(\mu) &= \| E(t^{k-1}, \mu)^{-T} \| \| r_{\mathsf{du}}^{k}(\mu) \| + \| \hat{x}_{\mathsf{du}}^{k}(\mu) \|. \end{split}$$

Define

$$\rho^{k}(\mu) := \frac{\|\tilde{r}^{k}(\mu)\|}{\|r^{k}(\mu)\|}.$$

It can be shown that $\rho^k(\mu)$ is bounded, i.e.,

$$\underline{\rho}^{k}(\mu) \leq \rho^{k}(\mu) \leq \overline{\rho}^{k}(\mu).$$

Ø

Primal-dual Output Error Bound (Cont.)

Efficient Output Error Estimation: Case 1

Corollary 1

[Zhang/Feng/Li/Benner '15]

Under the assumptions of Theorem 1, for all $\mu \in \mathcal{P}$, assume that

③
$$\{\| ilde{r}^{\kappa}(\mu)\|\}$$
: $\exists lpha \in \mathbb{R}^+$, s.t.,

$$lpha \leq \| ilde{r}^{k+1}(\mu)\|/\| ilde{r}^k(\mu)\| \quad \forall k=1,\ldots,T_n-1;$$

• $f(\cdot,\mu)$ is Lipschitz continuous, i.e., $\exists L_f \in \mathbb{R}^+$, s.t.,

$$\|f(x_1,\mu) - f(x_2,\mu)\| \le L_f \|x_1 - x_2\|, \quad \forall x_1, x_2 \in \mathcal{W}^n;$$

$$L_f < \alpha / \| E(t^k, \mu)^{-1} \|.$$

Then

$$\underline{\rho}^{k}(\mu) \leq \rho^{k}(\mu) \leq \overline{\rho}^{k}(\mu),$$

where $\underline{\rho}^k(\mu) = \frac{\alpha}{\alpha + L_f \| (E(t^{k-2},\mu)^{-1}\|)}, \ \overline{\rho}^k(\mu) = \frac{\alpha}{\alpha - L_f \| (E(t^{k-2},\mu)^{-1}\|)}.$

Remark: Assumption #3 is reasonable when $||E(t^k, \mu)^{-1}|| \lesssim 1$.

Efficient Output Error Estimation: Case 2

Corollary 2

[Zhang/Feng/Li/Benner '15]

Under the assumptions of Theorem 1, for all $\mu \in \mathcal{P}$, assume that $\|\tilde{r}^k(\mu)\|$: $\exists \alpha, \bar{\alpha} \in \mathbb{R}^+$, s.t.,

$$\underline{\alpha} \leq \|\tilde{r}^k(\mu)\|/\|\tilde{r}^{k+1}(\mu)\| \leq \bar{\alpha}, \quad \forall k = 1, \dots, T_n - 1;$$

③ $f(\cdot,\mu)$ is bi-Lipschitz continuous, i.e., $\exists \underline{L}_{f}, \overline{L}_{f} \in \mathbb{R}^{+}$, s.t.,

$$\|\underline{L}_f\|x_1-x_2\| \le \|f(x_1,\mu)-f(x_2,\mu)\| \le \overline{L}_f\|x_1-x_2\|, \quad x_1,x_2\in \mathcal{W}^n;$$

Then

$$\underline{\rho}^{k}(\mu) \leq \rho^{k}(\mu) \leq \overline{\rho}^{k}(\mu),$$

where $\underline{\rho}^k(\mu) = \frac{1}{\bar{\alpha}\bar{L}_f \|(\mathcal{E}(t^{k-2},\mu)^{-1}\|+1)}, \ \bar{\rho}^k(\mu) = \frac{1}{\underline{\alpha}\underline{L}_f \|(\mathcal{E}(t^{k-2},\mu)^{-1}\|-1)}.$

Remark: Assumption #3 is reasonable when $||E(t^k, \mu)^{-1}||$ is large.

Efficient Output Error Estimation

Recall that
$$\|e^k_{\mathsf{O}}(\mu)\|\leq ilde{\Delta}^k(\mu)=\Phi^k(\mu)|| ilde{ au}^k(\mu)||,\
ho^k(\mu)=rac{\| ilde{ au}^k(\mu)\|}{\|r^k(\mu)\|}$$
, we have:

Output Error Bound

$$\|e^k_{\mathsf{O}}(\mu)\|\leq \Delta^k(\mu):=\Phi^k(\mu)
ho^k(\mu)\|r^k(\mu)\|.$$

Efficient Output Error Estimation

Recall that
$$\|e^k_{\mathsf{O}}(\mu)\|\leq ilde{\Delta}^k(\mu)=\Phi^k(\mu)|| ilde{ au}^k(\mu)||,\
ho^k(\mu)=rac{\| ilde{ au}^k(\mu)\|}{\|r^k(\mu)\|}$$
, we have:

Output Error Bound

$$\|\boldsymbol{e}^{k}_{\mathsf{O}}(\boldsymbol{\mu})\| \leq \Delta^{k}(\boldsymbol{\mu}) := \Phi^{k}(\boldsymbol{\mu})\rho^{k}(\boldsymbol{\mu})\|\boldsymbol{r}^{k}(\boldsymbol{\mu})\|.$$

Estimating the Ratio $\rho^k(\mu)$

$$\rho^k(\mu) \approx \rho_\star := \frac{1}{T_n} \sum_{k=1}^{T_n} \rho^k(\mu_\star).$$

A computable output error estimation:

$$\|e^k_{\mathsf{O}}\| \lesssim \Delta^k_{\mathsf{est}}(\mu) :=
ho_\star \Phi^k(\mu) \|r^k(\mu)\|.$$

Here, μ_{\star} is chosen to be the parameter, so that

$$\mu_{\star} = \arg \max_{\mu \in \mathcal{P}} \psi(\mu), \quad \psi(\mu) = \frac{1}{T_n} \sum_{k=1}^{I_n} \Delta_{\text{est}}^k(\mu).$$

POD-Greedy Algorithm

How to compute V ?

Algorithm POD-Greedy

[HAASDONK/OHLBERGER '08]

 $\mathcal{P}_{\text{train}}, \mu_0, \varepsilon_{\text{RR}}(<1).$ Input: **Output:** Reduced Basis (RB): $V = [v_1, \ldots, v_N]$. 1: Initialization: N = 0, V = [], $\mu_{\star} = \mu_0$, $\psi(\mu_{\star}) = 1$. 2: while $\psi(\mu_{\star}) > \varepsilon_{\text{RB}}$ do Compute the trajectory $X := [x^1(\mu_*), \dots, x^{T_n}(\mu_*)].$ 3. 4: POD process: If $N \neq 0$, compute $x^{k}(\mu_{*}) := x^{k}(\mu_{*}) - \text{Proj}_{\mathcal{W}}[x^{k}(\mu_{*})], k = 1, ..., T_{n}$. Do SVD for X: $X = Q\Sigma F^{T}$, $v_{N+1} := Q(:, 1)$. Enrich V: $V = [V, v_{N+1}], \mathcal{W} := \operatorname{colspan}\{V\}.$ 5: N = N + 1. 6: Find $\mu_{\star} := \arg \max_{\mu \in \mathcal{P}_{\text{train}}} \psi(\mu).$ 7: end while

Remark: When T_n is large, adaptive snapshot selection can be applied.

• x is taken as a new snapshot only when x is "sufficiently" linearly independent from S_A , i.e., $\phi(S_A, x) > \varepsilon_{ASS}$.

• > • $\phi(S_A, x)$: an indicator to measure

• $S_{\rm A}$: selected snapshots subspace,

the linear dependency of S_A and x, e.g.,

 $\phi(S_A, x) = \angle(S_A, x).$

The idea of ASS is to discard the redundant linear information in the trajectory earlier, before the POD process.

[ZHANG/FENG/LI/BENNER '14]

Adaptive Snapshot Selection (cont.)

Algorithm Adaptive Snapshot Selection

Input: $\{x^k\}_{k=1}^{T_n}$, ε_{ASS} . Output: Selected snapshot matrix $S_A = [x^{k_1}, \dots, x^{k_\ell}]$. 1: Initialization: j = 1, $k_j = 1$, $S_A = [x^{k_j}]$. 2: for $k = 2, \dots, T_n$ do 3: if $\phi(S_A, x^k) > \varepsilon_{ASS}$ then 4: j = j + 1. 5: $k_j = k$. 6: $S_A = [S_A, x^{k_j}]$. 7: end if 8: end for

onclusions

Dutput: $\{x^{k}\}_{k=1}^{k}$, ε_{ASS} . **Output:** Selected snapshot matrix $S_A = [x^{k_1}, \dots, x^{k_\ell}]$. 1: Initialization: $j = 1, k_j = 1, S_A = [x^{k_j}]$. 2: for $k = 2, \dots, T_n$ do 3: if $\phi(S_A, x^k) > \varepsilon_{ASS}$ then 4: j = j + 1. 5: $k_j = k$. 6: $S_A = [S_A, x^{k_j}]$. 7: end if 8: end for

Remark: a relaxed condition $\phi(S_A, x^k) = \angle (x^{k_j}, x^k)$ can be employed for an efficient implementation.

ASS-POD-Greedy Algorithm

How to compute V?

Algorithm POD-Greedy

[HAASDONK/OHLBERGER '08]

Input:
$$\mathcal{P}_{\text{train}}, \mu_0, \varepsilon_{\text{RB}}(< 1).$$

Output: Reduced Basis (RB): $V = [v_1, \dots, v_N].$
1: Initialization: $N = 0, V = [], \mu_* = \mu_0, \psi(\mu_*) = 1.$
2: while $\psi(\mu_*) > \varepsilon_{\text{RB}}$ do
3: Compute the trajectory $X := [x^1(\mu_*), \dots, x^{T_n}(\mu_*)].$
4: POD process:
If $N \neq 0$, compute $x^k(\mu_*) := x^k(\mu_*) - \operatorname{Proj}_{\mathcal{W}}[x^k(\mu_*)], k = 1, \dots, T_n.$
Do SVD for $X: X = Q\Sigma F^T, v_{N+1} := Q(:, 1).$
Enrich $V: V = [V, v_{N+1}], \mathcal{W} := \operatorname{colspan}\{V\}.$
5: $N = N + 1.$
6: Find $\mu_* := \arg \max_{\mu \in \mathcal{P}_{\text{train}}} \psi(\mu).$
7: end while

ASS-POD-Greedy Algorithm

POD-Greedy + ASS

Algorithm ASS-POD-Greedy

[Zhang/Feng/Li/Benner '14]

Input:
$$\mathcal{P}_{\text{train}}, \varepsilon_{\text{RB}}(<1)$$

Output: Reduced Basis (RB): $V = [v_1, \dots, v_N]$
1: Initialization: $N = 0, V = [], \mu_{\star} = \mu_0, \psi(\mu_{\star}) = 1.$
2: while $\psi(\mu_{\star}) > \varepsilon_{\text{RB}}$ do
3: Compute the trajectory $X := [x^{1}(\mu_{\star}), \dots, x^{T_n}(\mu_{\star})],$
apply ASS to get: $X_{\text{ASS}} := [x^{k_1}(\mu_{\star}), \dots, x^{k_\ell}(\mu_{\star})]$ ($\ell \ll T_n$).
4: POD process:
If $N \neq 0$, compute $x^{k_j}(\mu_{\star}) := x^{k_j}(\mu_{\star}) - \operatorname{Proj}_{\mathcal{W}}[x^{k_j}(\mu_{\star})], j = 1, \dots, \ell$.
Do SVD for $X_{\text{ASS}}: X_{\text{ASS}} = Q\Sigma F^T, v_{N+1} := Q(:, 1).$
Enrich $V: V = [V, v_{N+1}], W := \operatorname{colspan}\{V\}.$
5: $N = N + 1$
6: Find $\mu_{\star} := \arg \max_{\mu \in \mathcal{P}_{\text{train}}} \psi(\mu).$
7: end while

Numerical Results

Numerical Examples:

- Linear convection-diffusion equation
- Burgers' equation
- Batch chromatography
- Continuous SMB chromatography

Example 1: Linear Convection-diffusion Equation

Primal-dual Error Bound/Estimation: Proposed vs. Existing

$$egin{aligned} & u_t = q_1 u_{xx} + q_2 u_x - q_2, & x \in (0,1), & t \in (0,1], \ & y = rac{1}{|\Omega_0|} \int_{\Omega_0} u(t,x) \, \mathrm{d}x, & \Omega_0 = [0.495, 0.505], \end{aligned}$$

 $\mu := (q_1, q_2), \ \mathcal{P} = [0.1, 1] \times [0.5, 5], \qquad n = 800, \quad T_n = 100.$

ROM-Opt.	0.020266	(0.0796, 1.0545)	202	0.58 / 58

 \star The optimizer: NLOPT_GN_DIRECT_L in NLopt package.

Model Descriptions

A more complex system:

- More parameters: $\mu := (m_1, \ldots, m_4, Q_F)$.
- **(a)** A multi-switching system: $x_{T+1}^0 = P_s x_T^{T_n}$, T is the time period.
- Ocyclic steady state (CSS) computation, the system is simulated many time periods till the CSS is reached.
- A parametric coupled system.

FOM:

$$\begin{cases}
A_{z}(\mu)c_{z}^{k+1} = B_{z}(\mu)c_{z}^{k} + r_{z}^{k} + t_{s}\kappa_{z}q_{z}^{k} \\
q_{z}^{k+1} = (1 - t_{s}\kappa_{z}\Delta t)q_{z}^{k} + t_{s}\kappa_{z}H_{z}\Delta tc_{z}^{k} \\
\end{cases}$$
ROM:

$$\begin{cases}
\hat{A}_{z}(\mu)a_{c_{z}}^{k+1} = \hat{B}_{z}(\mu)a_{c_{z}}^{k} + \hat{r}_{z} + t_{s}\kappa_{z}\hat{D}_{z}a_{q_{z}}^{k} \\
a_{q_{z}}^{k+1} = (1 - t_{s}\kappa_{z}\Delta t)a_{q_{z}}^{k} + t_{s}\kappa_{z}H_{z}\Delta t\hat{D}_{z}^{T}a_{c_{z}}^{k}
\end{cases}$$

 $\hat{A}_{z}(\mu) = V_{c_{z}}^{T} A_{z}(\mu) V_{c_{z}}, \ \hat{B}_{z}(\mu) = V_{c_{z}}^{T} B_{z}(\mu) V_{c_{z}}, \ \hat{r}_{z} = V_{c_{z}}^{T} r_{z}^{k}, \ \hat{D}_{z} = V_{c_{z}}^{T} V_{q_{z}}.$

Error Behavior during the RB Construction Process

Error bound decay during RB extension.

Behavior of ρ_{\star}

Behavior of the average ratio $\rho_{\star} = \frac{1}{T_n} \sum_{k=1}^{T_n} \rho^k(\mu_{\star})$ during the RB construction process for the SMB model.

Example 4: SMB Chromatography ROM Validation

Runtime comparison of the detailed and reduced simulations over a validation set \mathcal{P}_{val} with 200 random sample parameters. $\varepsilon_{RB} = 1 \times 10^{-3}$, $\varepsilon_{ASS} = 1 \times 10^{-5}$.

Simulations	Maximal error	Average runtime [s]/SpF
FOM $(n = 800)$	_	338.71(-)
ROM ($N = 83$)	$1.1 imes10^{-4}$	46.7 / 7

* The optimizer: NLOPT_LN_COBYLA in NLopt package.

Conclusions:

- An efficient output error estimation for MOR of nonlinear parametrized evolution equations is proposed.
- Adaptive Snapshot Selection (ASS) is proposed, so that the offline time is largely reduced.
- Application to convection dominated problems, e.g. batch chromatography and linear SMB chromatography, is presented.

Outlook:

- More reliable and efficient estimation of $\rho^k(\mu)$.
- Reduced basis methods for SMB chromatography with uncertainty quantification (UQ).
